

What to expect during each stage of treatment and beyond

Liver Cancer

This information sheet tells you what you can ask for before, during and after your liver cancer treatment. You can ask your team for more information and support.

Working with your team means you can make sure you are getting the treatment, information and support that are right for you.

1. Your doctor visit

Your doctor should do a check up to see if they can find what is making you feel unwell. They will ask you about any symptoms you might be having. You might have a pain or lump on the right side of your stomach.

Your doctor should work with you to make sure you have the information and support you need. You can ask your doctor about:

- What is happening in your body and why it could be happening
- What will or might happen
- How you are feeling and how to stay emotionally healthy
- Who you can talk to about getting the support you need
- Where you can get more information and support

Your doctor might arrange tests to check for liver cancer:

Ultrasound

Sound waves are used to make a picture of the liver.

Blood Test

The doctor will take a sample of your blood. They will test your blood to see if your liver and kidneys are working well. This is called a liver and renal function assessment.

Your doctor might send you to get more tests with a specialist. Your specialist is a doctor that is trained in working with people with liver cancer. Your doctor should give the specialist information on your health in the past, if someone else in your family has had cancer and your test results.

You can bring a family member or friend to your visits. You can ask your doctor for more information and support to make sure you have what you need.

2. Tests

The specialist might do more tests to see if you have liver cancer. This is called a diagnosis. If you do have liver cancer, the tests will show how the cancer is growing or if it has spread. This is called staging.

You can ask the specialist:

- What tests you are going to have
- What will happen in the tests
- What the tests will tell you

You might have one test or a mix of tests:

Computed tomography scan (CT scan)

Computers and x-rays are used to make a detailed picture of the liver.

Magnetic resonance imaging scan (MRI)

A scan where magnetic fields and radio waves are used to make a detailed picture of the body.

2. Tests cont'd

Position emission tomography scan (PET)

A small amount of radioactive material is injected and your whole body is scanned to show where the cancer is.

You could have a PET scan, but you might not need one.

Biopsy

Small samples of liver is taken to check under a microscope. You could have a biopsy, but you might not need one.

You can ask your doctor about finding a cancer peer support group. It can help knowing that there are other people who understand what you are going through. Your friends and family can talk to a support group for carers.

3. Treatment

Your specialist should work with a team. Your team is made up of people that understand liver cancer.

Your team will review your test results. They should ask you what you want and need. You should work together to make the best plan for your treatment.

You can ask your team:

- What treatment you are having
- Why you are having that treatment
- What will happen in that treatment
- What the treatment will do
- When the treatment will start and how long the treatment will take
- Risks and benefits of the treatment
- How you might feel during the treatment, side effects and what you can do to feel as well as possible
- What you can expect after the treatment

Your team might suggest you take part in a clinical trial. A clinical trial is used to test a new treatment, or to see if a treatment works better than another. You can ask for more time, or a second opinion before you decide on your treatment.

Complementary therapies include things like massage, acupuncture and meditation as well as other medicines you might take at the same time as your treatment. Some therapies might not work well with your treatment. Therefore, it is very important to talk to your team about any complementary therapies you are using, or would like to use.

You might have one treatment or a mix of treatments:

Local ablative therapy is where radio waves are used to heat and kill the cancer. This will kill the cancer without cutting it out of your body.

It is the most common treatment for liver cancer.

Surgery is where the cancer is cut out.

It is used if you have early liver cancer. Your surgery should be done by a surgeon who is very experienced and does a lot of liver surgeries.

Regional therapy uses heat with chemotherapy or radiation therapy injected straight in to the liver.

It is used to slow down how fast the cancer is growing.

Liver transplant is where your liver is cut out and a liver from another person called a donor is put in.

It might be used if you have cirrhosis. Cirrhosis is a disease where your liver stops working.

3. Treatment cont'd

If your liver cancer has spread to other parts of your body you might have treatment for advanced liver cancer:

Chemotherapy is used to stop the cancer growing.

Surveillance is where your team will watch the cancer to see what it does.

Surgery might be used with surveillance.

You might also have medicine to help with symptoms and side effects of your liver disease.

For more information about treatment and side effects you can ask your doctor or **visit** www.cancer.org.au/about-cancer/treatment

Your team should talk to you about your needs before, during and after your treatment. You can ask for information and support at any time to make sure you have everything you need. Your team can connect you with other services and health professionals to make sure you stay physically and emotionally healthy.

4. After your treatment

After your treatment is finished, your doctor should give you a treatment summary. Your treatment summary has all of the information on the treatment you received:

- Tests you had to diagnose your liver cancer, and the results of these tests
- Treatment you had, and when you had it
- Support services and other treatment plans you received.

Your specialist should work with you to make a plan now that your treatment is finished. You should have a follow-up plan that includes:

- The follow-up that is best for you
- Plans for managing any side effects of treatment
- How to get help quickly if you think your cancer has come back or got worse

Your doctor should work with you and talk about:

- Finding more information and support to keep physically and emotionally well, and get what you need
- Signs and symptoms to look for that might mean the cancer is coming back
- Prevention and healthy living

Sometimes liver cancer can come back after treatment. It is usually found at a follow-up visit, or if you notice any symptoms come back. It is important to have regular check-ups. If you notice anything different go to your doctor. You can ask your doctor for a check-up and for information and support.

6. Living with cancer

Side effects

Some people get side effects during and after their treatment. Side effects are your body responding to the treatment you are having. They are normal, but can make you feel unwell. You might have side effects straight away, not at all, or months after your treatment.

You can talk to your doctor about your side effects or **visit** www.cancervic.org.au/about-cancer/survivors/long-term-side-effects

Advance care plan

Your team might work with you to make an advance care plan. An advance care plan is a way of setting out your wishes and making sure everyone knows what you want in future medical care.

You can talk to your doctor about making an advance care plan together or **visit** www.advancecareplanning.org.au

6. Living with cancer cont'd

Palliative care

Palliative care is used at different stages of your treatment to help you feel well. Palliative care can help with pain relief, to reduce your symptoms and to improve your quality of life.

You can talk to your doctor about the type of palliative care that is best for you or **visit** www.palliativecare.org.au

Cost

There are costs at every stage of your cancer including treatment, accommodation and travel. You might have costs if you are having treatment in a private health service even if you have private health insurance. You can talk to your team and your private health insurer if you have questions about the cost of each treatment you might have.

You can also talk to the social worker at your hospital.

You can talk to your doctor about the cost of your treatment or **visit** www.canceraustralia.gov.au/affected-cancer/living-cancer/dealing-practical-aspects-cancer/costs-treatment

You can talk to your doctor about the cost of accommodation and travel or **visit** www.cancercouncil.com.au/get-support/practical-support-services

There are a lot of things to think about when you have liver cancer. There is also a lot of information and support. It is important that you do what is right for you. You can work with your team to make sure you have the best care.
